Hi Rob, Truly hearing impaired people can get a waiver for the CW testing
by bringing a letter from a medical doctor stating that fact.

Cecil, the only problem with the waiver, is it is only possible if you have already passed a code test. If you can pass a 5 wpm test, but not, medically, a 13 or 20 wpm test, then you can get a waiver. However, if you have never passed any code test, the waiver does no good. If you can pass it with flashing lights or something, then maybe it could count, but that depends on whether that method will count for a 5 wpm test or not.

Except that the ITU regulations state that an applicant must be able to "...receive by ear, texts in Morse Code signals." If one believes that this ITU regulation is legally binding on the United States no matter what, then the FCC has no power to allow a Morse test that does not involve receiving by ear, no matter what. If, however, the U.S. can waive this provision of the ITU regulations, then that anti-no-code-HF argument (that the ITU requires a Morse test) goes right down the drain!

To: ham-policy@ucsd.edu

Greetings:

The Code/No-Code issue is as simple as this: You learn the code, you get HF privileges. You don't learn the code, you live WITHOUT HF privileges. You may whine, complain, and take up a lot of bandwidth screaming "unfair," but, at the end of the day, you won't have any HF privileges unless you learn the code! Reality, folks, just plain 'ol reality!

73 de Larry, WR2F

... CW and Morse Code are NOT obsolete! Non-Progressive "hams" are!

Afraid not. CC&R's are generally considered personal contracts between parties and not laws. Thus PRB-1 does not apply, unfortunately. PRB-1 applies only to government bodies and then only in a limited manner.

When I purchase a house I intend to have a lawyer go over deed restrictions with a fine toothed comb.

Good luck!

|>Ed Ellers <edellers@delphi.com> writes:

|>>>1. Amateur Satellites

|>>Only available during short portions of the day.

|>

|>The Phase III satellites hang out at apogee for about 12 hours or so. And,
|>there's usually an LEOsat pass every couple of hours. Plenty of spectrum time.
|>Plus, with the PacSats, it isn't even necessary for you to be up and around
|>your equipment when the pass comes.

And recently as in this during this summer, the orientation of A0-13 (the more popular of the 2 Phase III birds still operational) was such that communication was tenuous at best. Plus the number of stations you can contact is a tiny fraction of the stations and countries you can contact on HF. Or would you care to post the names of the DXCC Satellite Honor Roll members?

|>>>2. Moonbounce

|>>Which requires large, highly directional, steerable antennas and other
|>>expensive gear, making it an order of magnitude less practical than HF SSB (or
|>>HF CW).

|>

|>Moonbounce can readily achieved with four long boom arrays, a pair of 4xc250s,
|>and a decent preamp. About the only ingredient that doesn't have an equivalent
|>in a decent HF shack is the elevation rotor, about \$150-200.

Well given that the most popular selling HF antenna is still the vertical
(according to 3 manufacturers of beams that I just spoke to) and that a
barefoot HF rig will get you around the world, and that the number of EME
stations is even far less than the number of satellite stations, you've
pretty well narrowed down one's options. In addition, if the majority of
hams are in suburban/urban areas like the rest of the population, then they
trash their neighbors consumer electronics gear with front end over load
from 1500 watts ERP that 1 beam and 160 watts will produce much less the
50-200 KW ERP that a reasonable EME station has. Also try to make four
long boom yagis inconspicuous.

|>>>3. Meteor Burst

|>>Which is available only on rare occasions, not on a day-to-day basis.

|>

|>This is so untrue as to be comical. Meteor burst not only occurs on a
|>day-to-day basis, but is in fact *the* most reliable ionospheric phenomenon
|>known. In fact, StratCom (formerly SAC) relies on it as *the* communications
|>medium which *will* survive. Thousands of useful trails are generated every
|>day by particles the size of coffee grounds.

Within the amateur bands and reasonable power levels, only 6 meters offers
reasonable possibilities on a regular basis. And MS contacts are certainly
the most minimal contacts made, often exchanging just the bare mininum to
count as a contact. Hardly regular communication. Also most MS contacts
are no greater than 1500 miles which for the great majority of the US makes
it non-DX in the HF sense.

||>One concludes (and I could be far nastier here) from the above that you've
|>never really tried to work VHF+ DX. Give it a whirl. It's truly leading edge
|>stuff.

Ah, but I have tried it and it's fun. But comparing it to HF is like
suggesting that Michigan's nearly statewide repeaters is the same as talking
to the guy that was on in Qatar this morning on 20 meters.

|>>If these three techniques are so wonderful -- and considering how much wider
|>>the VHF and UHF spectra are than the amateur HF allocations -- why aren't hams
|>>using them instead of HF SSB?

|>

|>Historical inertia, more than anything else. The HF bands have "been around"
|>far longer, and therefore have a larger user base, at least as far as DX is
|>concerned.

Hardly. It's much more a matter of cost. With the most minimal of looking

in rec.radio.swap or the Yellow Sheets, one can purchase a rig capable of world wide communications on HF for under \$200. I have several such radios in my shack right now that I've purchased recently. One of those rigs plus \$20 in wire allows you to communicate with several orders of magnitude more amateurs around the world than equipment 10 times as expensive using the above techniques.

Suggesting that VHF+ communications and HF communications are similar is simply not true.

No, I have not implied such. I am saying that your contention is as wrong as
the other, NOT that since you hold the first belief that you therefore must
hold the second.

Actually, 10 *is* an HF band, since HF runs from 3-30 MHz, VHF from 30-300 and
UHF from 300-3000.

I don't see any proof here that just because someone has not passed a
code test means they are an appliance operator. The following statement
may be correct, but it is certainly not saying that all Technicians are
appliance operators (as is implied above):

>

>The truth of the matter is that most folks who operate solely on the VHF+ bands
>*are* appliance operators, since the vast majority of operation is FM.

Please include phrases like this "vast majority" in arguments about any
license class. An all encompassing "all" is almost certain to be false.
(Not necessarily always, though.)
